

DevRev Boundary & Governance Position

Nine technology decision records TDRs that establish where DevRev fits within the Camping World enterprise architecture, what it owns, what it consumes, and how it is governed, alongside Customer 360, the agentic orchestration layer, and other future agentic SaaS platforms.

OWNER	EA / Architecture Governance	STATUS	Draft — for ARB ratification	FORUM	Architecture Review Board	REVIEW	Annual + on material vendor change
-------	------------------------------	--------	------------------------------	-------	---------------------------	--------	------------------------------------

TDR ID	Title	Decision	Rationale
TDR-DR-01	Platform Role: Engagement, Not System of Record	DevRev is positioned as L1 Experience and L2 Orchestration within the Support and Product Ops domains only. Not a system of record for customer master, ESP, vehicle, inventory, finance, or membership.	Layer discipline; prevent master-data lock-in; protect golden-record integrity.
TDR-DR-02	Customer 360 Authoritative; KGraph Downstream	Informatica IDMC Customer 360 is the enterprise golden record. DevRev KGraph provides the support-relationship context, joined via golden_id. NO customer master attributes are sourced from DevRev.	Eliminate competing truths; protect the 29M-record consolidation.
TDR-DR-03	DevRev Agents Use Enterprise Agent Contracts	Any DevRev workflow acting on production data publishes an agent contract (goal, tools, models, SLO, cost, risk class, HITL, rollback) before GA promotion.	Vendor automation under the same governance as in-house; enables RAI Council oversight.
TDR-DR-04	Snap-ins Register in the MCP Tool Registry	DevRev Snap-ins exposing or consuming enterprise tools are catalogued in the MCP tool registry with signed manifests, ACLs, and rate limits. NO point-to-point integrations.	Single tool discoverability surface; consistent ACL and observability.
TDR-DR-05	LLM Calls Route Through Enterprise Router	DevRev AI features call enterprise LLM endpoints via the cost-aware router for any Camping World data. Vendor-default model selection on enterprise data is prohibited.	FinOps visibility; RAI governance; multi-vendor flexibility.
TDR-DR-06	Run / Audit Evidence Flows to Enterprise Run Store	DevRev agent runs touching customer, financial, or regulated data emit events to the enterprise Run Store (LO). DevRev's internal run logs are secondary evidence only.	Single audit surface; SOX / CCPA defensibility; uniform replay & eval.
TDR-DR-07	Cross-Domain Orchestration Owned by Enterprise L2	DevRev orchestrates within Support and Product. Workflows that traverse across domains: ESP-CRM, DMS, Vehicle 360, Inventory, or Finance are owned by the enterprise L2 orchestrator; integration is via L5 events.	No vendor-trapped cross-domain logic; clean domain boundaries.
TDR-DR-08	Data Access via Domain APIs and Consent Vault	DevRev reads customer, vehicle, and membership data only through governed domain APIs. Consent resolved via Consent Vault at the moment of use; DevRev does not cache consent.	Privacy-by-design: minimize the blast radius of consent changes.
TDR-DR-09	Tracked in APM with Annual ARB Review & Risk Entry	DevRev is registered in APM with owner, lifecycle, integrations, and dependencies. Standing risk-register entry for vendor-managed AI behavior. Annual ARB review.	Lifecycle discipline: visibility into vendor AI behavior.

WHY THIS MATTERS DevRev is one of several agentic SaaS platforms arriving over 24 months (Salesforce, ServiceNow, Microsoft, OEM portals). This pack sets the boundary pattern once, so each vendor is an integration question, not an architecture re-litigation.	NEXT 30 DAYS 1) Validate current DevRev footprint with the account team. 2) Ratify TDR-DR-01 through 04 at the next ARB. 3) Open APM + risk-register entries. 4) Stand up event-backbone flow to Run Store.
